EXECUTIVE SUMMARY

As part of its work to harmonize safety assessment of CEPI-funded vaccines, the Safety Platform for Emergency vAccines (SPEAC) Project has generated a list of adverse events of special interest (AESI) for safety monitoring based on one or more of the following criteria:

- 1) known association with immunization or a specific vaccine platform;
- 2) theoretical association based on animal models;
- 3) occurrence during wild-type disease as a result of viral replication and/or immunopathogenesis.

COVID-19 is unique as an emerging pandemic pathogen with an ever-expanding variety of clinical manifestations which might occur as presenting complaints and/or emerge during and following the course of acute disease. The first SPEAC COVID-19 AESI list was created in March 2020 based on the experience in China; it was updated in May 2020 as the global experience with the SARS-CoV-2 viral infection expanded. The May 2020 list was adopted by the WHO Global Advisory Committee on Vaccine Safety (GACVS) at their May 27-28, 2020 meeting. Subsequently, SPEAC implemented a systematic review process to ensure an ongoing understanding of the full spectrum of COVID-19 disease and modification of the AESI list accordingly. The first evidence-based update was completed in September 2020 with no AESIs added to the May 2020 list.

This document provides detailed methods and results of the December 2020 COVID-19 quarterly update. Separate annexes are included consolidating all reviews since March 2020, summarizing publication type and frequency of events, by body system. A companion excel spreadsheet has been prepared which contains the full citations with download links included in the March, May, September and December 2020 updates separated into tabs by body system. Four secondary objectives are also addressed: 1) a reassessment of the need for Brighton case definitions to be created for all the AESIs on the May 2020 list, 2) consideration of new AESIs for addition to the list, 3) consolidation of the systematic reviews presented in May, September and December 2020 and 4) consideration of the need for a change in focus of the next update due in March 2021.

Based on the findings presented in the December 2020 update SPEAC recommends the following:

1. Three new events are added to the COVID-19 AESI list: rhabdomyolysis, subacute thyroiditis and acute pancreatitis.
2. For the prior listed AESI acute kidney injury recommend use of the international criteria defined by the Kidney Disease Improving Global Outcomes (KDIGO) expert consensus group in 2012 rather than develop a new Brighton case definition.
3. For the prior listed AESI acute liver injury, adopt what has been used in many COVID-19 publications reporting elevations above the upper normal limit of >3-fold for AST/ALT and >2-fold for total bilirubin, GGT and ALP rather than develop a Brighton case definition.
4. Pending publication of the Brighton case definition on cardiovascular injury which will focus on myocarditis and pericarditis, and in-depth review of existing meta-analyses and systematic reviews, defer a decision regarding development of additional Brighton case definitions for the other entities included in cardiovascular injury (arrhythmia, acute coronary syndrome, heart failure, cardiogenic shock, stress cardiomyopathy and microangiopathy).
5. For the next COVID-19 update, due in March 2021, limit the focus to COVID-19 disease outcomes in pregnancy and childhood along with long term complications.

1. Background

CEPI has contracted with the Brighton Collaboration, through the Task Force for Global Health, to harmonize the safety assessment of CEPI-funded vaccines via its Safety Platform for Emergency vACCines (SPEAC) Project.

A key aspect of this harmonization has been creation of lists of priority potential adverse events of special interest (AESI) that are relevant to vaccines targeting CEPI target diseases.

The first AESI list for COVID-19 was approved March 5, 2020 based on the first published experiences from China. Subsequently PubMed searches were done on a daily basis and new articles screened for newly emerging COVID-19 clinical patterns and complications. A full description of the methodology and results including citations for the first two COVID-19 AESI lists is available on the Brighton website ([tps://brightoncollaboration.us/wp-content/uploads/2020/06/SPEAC_D2.3_V2.0_COVID-19_20200525_public.pdf](https://brightoncollaboration.us/wp-content/uploads/2020/06/SPEAC_D2.3_V2.0_COVID-19_20200525_public.pdf)). Figure 1 shows the timelines of different updates.

FIGURE 1. SEQUENCE OF UPDATES ON THE COVID-19 AESI LIST

A first extended/updated COVID-19 AESI list was presented to the WHO global Advisory Committee on Vaccine safety (GACVS) at a virtual meeting held May 27-28, 2020. The GACVS agreed to adopt that AESI list.¹ At the time it was clearly understood that new AESI could be added to the COVID-19 list as needed based on new knowledge learnt during the global pandemic. Accordingly, SPEAC put in place a plan for a continued systematic search of the published literature related to COVID-19 disease complications. The next update covered citations published from May 16 through August 8, 2020. (SO2_D2.1.1_V1.1_COVID-19_AESI update Aug 20, available in the Developers Toolbox and the Brighton website). No changes to the AESI list were recommended based on the update in September 2020 but several potential entities were flagged as possibilities pending further evidence, including subacute thyroiditis, pancreatitis, rhabdomyolysis and autoimmune hemolytic anemia. These were one focus of the subsequent quarterly update which is presented in this deliverable.

One reason for updating the AESI list is to be prepared to monitor these events pre and post-introduction and to assess whether case definitions are needed.

From May through August 2020, BC working groups were set up to develop Brighton case definitions for various COVID-19 AESI. These included Vaccine Associated Enhanced Disease (VAED), Acute Respiratory Distress Syndrome (ARDS), Multisystem Inflammatory Disease in Children (MISC), acute cardiovascular injury (including myocarditis, pericarditis, arrhythmia, heart failure, cardiogenic shock, stress cardiomyopathy, coronary artery disease and microangiopathy) and coagulation disorders (including thrombosis, thromboembolism and bleeding disorder/DIC). The acute cardiovascular injury working group decided in September to limit the focus of the case definition to myocarditis and pericarditis. Similarly, the coagulation disorder working group decided, also in September, to limit the focus of that case definition to thrombosis and thromboembolism. Thus, a second focus of the second quarterly update was to monitor the emerging evidence on the other manifestations of acute cardiovascular injury as well as COVID-19 related hemorrhagic disorders to discern whether or not additional case definitions were needed.

A call for working groups on acute kidney injury and liver injury was posted on the Brighton Collaboration site in August 2020 but neither had been formed as of the end of the screening period for the second quarterly review (November 13th). Thus, a third needed focus of the second quarterly review was to re-examine the evidence for acute kidney and liver injury in order to revisit the need for a new Brighton case definition.

2. Objectives of this deliverable

Primary

1. Present the results of the December 2020 quarterly update for the COVID-19 AESI priority list.

Secondary

Revisit prioritization of AESI for development of new Brighton case definitions related to acute cardiovascular injury other than myocarditis/pericarditis, bleeding disorders, acute kidney injury and acute liver injury.

2. Propose additions to the AESI list if supported by the evidence related to complications of COVID-19 infection.
3. Consolidate the literature reviewed as part of the COVID-19 landscape analysis from January 1 through the end of the period for the December 2020 quarterly update. Determine whether any changes to the COVID-19 literature update processes are indicated going forward for the next quarterly update.

3. Methods

3.1 December 2020 quarterly update of literature regarding COVID-19 disease complications

To develop the May 2020 list of potential COVID-19 AESI, a very broad search strategy was used capturing all COVID-19 publications from PubMed as well as pre-prints from bioRxiv and medRxiv. All citation titles were screened by one reviewer (Barb Law) from Feb 17, 2020 and those that addressed the clinical course and complications of COVID-19 were included in a further screen of abstract and/or full text. Duplicates were removed as were non-English articles. Letters to the editor were included as many of these contained relevant case report

and case series data that informed the early development of the AESI list. Given the overwhelming volume of publications, the screening was not done in a systematic fashion following PRISMA guidelines. All articles included in the AESI list finalized May 25, 2020 were captured in the appendices of the D2.3 V2.0 deliverable document (available at Brighton website link in Background above).

Searches were discontinued May 16, 2020 in order to develop the final AESI list based on screened in citations and prepare a presentation to the WHO Global Advisory Committee on Vaccine Safety.

From May 16 through the end of May, over 5000 new citations were published. Ongoing review of such a large volume of literature using similar methods as those used to generate the first list was deemed impossible. Accordingly, the screened in articles for the May AESI list were reviewed and key words identified to inform a new search strategy. Also, the nature of the excluded articles which did not inform the AESI list (e.g. therapeutic/prevention strategies, infection control, transmission and other basic virology articles, changes in patterns of healthcare during the pandemic) was used to develop a list of exclusionary terms.

For the quarterly update in September 2020 a revised search strategy was developed. The second and final search strategy developed for the September 2020 quarterly update was used also for this December quarterly update (Annex 1). The only change in the final September 2020 search strategy was to exclude, based on PMID number, all articles included in the searches conducted prior to August 8th, 2020.

Searches for this December 2020 quarterly update were conducted Sept 9th, Oct 9th and Nov 13th. The first search captured articles published from Aug 8 which was the end date for the 1st quarterly update searches. The results from each search were loaded into an excel spreadsheet. A single expert (Barb Law) screened all citations. Several could be screened out based on title alone. Any that could not clearly be screened in or out were then retrieved for abstract and/or full text review.

The brief category name and descriptive rationale for exclusion included:

- 'Duplicate': duplicate of previously captured citation.
- 'Therapy/Testing/Prevention': as implied, articles with the main focus on COVID-19 therapy, testing or prevention of disease.
- 'Healthcare': focus on healthcare during the COVID-19 pandemic.
- 'Unrelated': article unrelated to COVID-19 infection in humans, such as animal model studies or other Coronavirus or related pathogens.
- 'Limited focus': clinical course information included but on a very small scale such as the first case report in a country.
- 'Noncontributory': articles that addressed entities already included on the AESI list with no new information such as an additional case report or limited series of cases.
- 'Non-English': articles in any language other than English.
- 'Comment/Response/Erratum': commentaries including editorials, letters to the editor, author responses to letters to the editor and errata. Of note, full text screening was required for most commentaries because several letters to the editor include case reports, case series and some studies relevant to the AESI list.

For all articles screened out, a distinction was made for whether it was done based on title alone or after abstract and/or full text review.

All screened in articles were categorized according to: 1. Primary topic (mainly by body system); 2. Subgroup 1 (mainly specific diagnosis or population subgroup); and 3. Subgroup 2 (type of article) using the following terms:

1. Primary topic:

- A. **Categories from previous AESI list:** Cardiac, Neurologic, Dermatologic, Hematologic, Gastrointestinal, Liver, Kidney, Multisystem inflammatory syndromes, Musculoskeletal, Ocular and Respiratory.
- B. **Additional categories relevant to AESI list:** Autoimmune, Co-infection, Endocrine, Enhanced disease, Pregnancy, Psychiatric, Mixed clinical (for reports, mainly reviews and meta-analyses, of extra-pulmonary manifestations of COVID19) and Other. A new category for chronic complications was added as part of this review given the emergence of the 'long haul' syndrome.
- C. **Articles to keep for potential relevance to AESI Tools but not to the AESI list per se:** Background rate, Risk factor, and Pathology were also categorized and kept but not all reviewed in depth for the AESI list. Within the pathology subgroup, any relating to autopsy findings were to be reviewed in full.

2. Subgroup 1:

Two groups of terms were used based on whether or not an AESI was already included in the list for COVID19 finalized in May 2020.

A. Relevant to already identified AESI:

- **Cardiovascular:** acute coronary syndrome, aneurysm, arrhythmia, endothelial dysfunction, heart failure, MI, myocarditis (including pericarditis), STEMI (For ST elevation myocardial infarction), sudden death, Takotsubo syndrome (stress cardiomyopathy);
- **Neurologic:** acute disseminated encephalomyelitis (ADEM), CNS bleed, encephalitis, encephalopathy, Guillain Barré Syndrome (GBS), myelitis, seizure, Smell/Taste (for anosmia, ageusia, hyposmia, hypogeusia and dysgeusia); Cranial Nerve – other;
- **Hematologic:** coagulopathy, idiopathic thrombocytopenic purpura, ischemia, pulmonary embolus, stroke, thrombocytopenia, thromboembolism, thrombosis;
- **Dermatologic:** angioedema, chilblain, erythema multiforme, urticaria, vasculitis, other rash;
- **Liver:** injury;
- **Kidney:** injury;
- **Multisystem inflammatory syndromes:** multisystem inflammatory syndrome in children (MISC);
- **Respiratory:** ARDS

B. Entities not on the May AESI list:

several were known to have been reported but not in sufficient numbers to merit inclusion on the AESI list; others were added as search results were screened from May 16 to Aug 15. These included:

- **Clinical diagnoses:** abscess, adrenal injury, alopecia, arthritis, autoimmune hemolytic anemia, cholecystitis, chronic complication, conjunctivitis, diarrhea, enteritis/colitis, hemophagocytic lymph histiocytosis, hepatitis, hyperferritinemic syndrome, hyperglycemia, hyponatremia, Kawasaki syndrome, mania, myositis, pancreatitis, parotitis, peripheral neuropathy, pneumomediastinum, pneumothorax, psychosis, retinopathy, rhabdomyolysis, sudden death, thyroiditis, uveo-retinitis;
- **Pregnancy/post-partum related:** breast milk, ectopic pregnancy, foetal, HELLP syndrome, mortality, neonatal, outcomes, placenta, preeclampsia/eclampsia, transmission;

- **Non-specific entities that could lead to identification of new AESI:** autopsy, general, mixed clinical, other, outcomes, severity, virus in tissue
 - **Host-specific other than pregnancy-related:** Adult, Geriatric, HIV, Pediatric
3. **Subgroup 2:** Case Reports (including case series), Commentary (mostly excluded but some kept because of reference to important publications to ensure captured in review), Guideline, Meta-analysis, Pathogenesis, Registry, Review, Study.

3.2 Review of evidence related to COVID-19 AESI adopted in May 2020

In the September 2020 quarterly update for AESI already on the May 2020 COVID-19 list and targeted for new case definitions, the number of new articles published for each entity by subgroup and article type were counted but the full article was not reviewed. A spreadsheet for each system group was created to capture all newly published citations in order to support the case definition working groups.

Initially a similar process was intended for the December 2020 quarterly update. However, as noted in the Background section above, the cardiovascular injury and coagulation disorder working groups decided to limit their case definition scope to myocarditis/pericarditis and thrombosis/thromboembolism respectively. These decisions raised a question of whether or not the other entities related to cardiovascular injury as well as hemorrhagic manifestations of coagulation disorders merit a separate Brighton case definition. As a first step to address this a quantitative and qualitative summary of all articles included in the COVID-19 landscape analyses from January 1 through November 13th was prepared to capture total number of citations for each manifestation of cardiac injury and coagulation disorders as well as to look at the distribution by article type (meta-analysis, systematic review, pathogenesis/hypothesis, study and case report/case series).

A slightly different approach was used for acute liver injury (ALI) and acute kidney injury (AKI) since the working groups had not yet been formed. A decision was made to review these AESI in greater depth as part of the second quarterly review to learn of any new evidence or greater understanding of the pathogenesis of these entities that might change the priority for having a new Brighton case definition. A secondary objective was to understand what, if any, definitions of ALI and AKI were being used in the COVID-19 literature. Reviews and meta-analyses of each were given priority for full text review.

3.3 Evidence Review for Consideration of Additions of New AESIs to the COVID-19 list

The full articles for all included citations with a focus on rhabdomyolysis, pancreatitis, acute thyroiditis and autoimmune hemolytic anemia was read in order to capture age, gender, timing of onset relative to general symptoms and course of COVID-19 as well as underlying comorbidities. For other entities accompanying COVID-19 illness, not yet on the AESI list, the number of case reports for each was determined and summarized in a tabular format, similar to what was done in the September 2020 quarterly update.

3.4 Consolidation of all Systematic search results for COVID-19 complications

The May 2020 COVID-19 landscape analysis covered January 1st through May 16. To enable summarizing the emerging evidence by body system a tabular summary was used to note publication type (Review, Meta-analysis, Pathogenesis/hypothesis, Study, Case Report), first author, country of origin and topic area. A full citation list was provided, below each tabular summary. Appendices were presented by system including Cardiovascular, Neurologic, Hematologic, Dermatologic, Gastrointestinal, Kidney, Multisystem inflammatory disease, Musculoskeletal, Ocular and Respiratory.

The September 2020 quarterly update, covered May 16 through August 8th. All citations from each search period were loaded into an excel spreadsheet to facilitate screening. All included publications were then distributed to separate tabs for each of the body systems included in the May search. Cited references in the September 2020 quarterly update deliverable itself were limited to those discussed in the results section related to the four entities flagged as possible new AESI for future consideration (rhabdomyolysis, pancreatitis, subacute thyroiditis and autoimmune hemolytic anemia). At the time the September 2020 quarterly update was presented a request was made to consolidate all the COVID-19 systematic search results. This is being done as part of the December 2020 quarterly update.

The screening process for the December 2020 quarterly update is described in 3.1 above. All included citations were added to those from the September quarterly update. In order to have the January to May 16 citations included in the spreadsheets the PMIDs from screened in citations for that period were used to gather the citations and they were added to the spreadsheet. Differentiation of articles acquired in the separate search periods can be identified using the 'search date' column: January to May search (16th May 2020); September 2020 quarterly update (06/12/2020, 07/08/2020, 07/21/2020, 07/31/2020, 08/07/2020); and December 2020 quarterly update (09/09/2020, 10/09/2020, 11/13/2020).

In addition, the appendices included in the May 2020 COVID-19 review were updated to add a tabular summary for all the September 2020 quarterly and December 2020 quarterly added citations. For AESI already on the May 2020 list, numbers of new publications were captured rather than itemizing them individually. For new entities, individual itemization was used. A separate Annex was created for acute liver injury instead of including it within the Gastrointestinal Annex. New appendices were added for endocrine and long-term complications of COVID-19.

3.5 Consideration of Need for Changes to the Systematic Review Process for the next Quarterly Update

The enormous volume of publications relevant to COVID-19 disease course and complications merits an ongoing consideration of whether or not the exhaustive process currently in place for the quarterly updates is justified. This is underscored by the initiation of the first COVID-19 vaccine programs in several countries which will require an increased focus on vaccine safety issues. Thus, as part of the December 2020 quarterly update records were kept of the time required for each aspect (screening, detailed review of articles to summarize evidence and creating the update deliverable).

4. Results

4.1 Summary of Excluded Publications

From Aug 7 through Nov 13, 3 separate searches were run; yielding 3901 citations, of which 2141 (54.9%) were screened in and the other 1760 (45.1%) screened out. Among the articles screened out the decision was based on title alone for 68.3% (1202) and on review of abstract and/or full text article for 31.7% (558). Table 1 summarizes the reason articles were screened out for all search dates, separated by whether it was based on title alone or review of abstract/full text. The table also shows variation in distribution of reason excluded for all separate search dates without distinguishing whether exclusion was by title alone or abstract / full text.

A notable change from the September 2020 Quarterly Update was a decrease in duplicates (36.4% of articles screened out in Q1 versus 0.6% in Q2) as a result of adding already screened PMIDs to the exclusion terms for the search strategy.

The search period was 3 months for both September 2020 and December 2020, but the total numbers of articles retrieved by the same search strategy decreased from 4679 in September to 3901 in December and the major reason for the drop was exclusion of duplicates ahead of time by including the PMIDs in the 'not' part of the search strategy.

TABLE 1. REASONS FOR EXCLUDING ARTICLES OVERALL AND BY INDIVIDUAL SEARCH DATE FOR DECEMBER 2020 QUARTERLY UPDATE

Reason for Exclusion	All Search Dates: Total (%) Excluded by:		Distribution of Reason for Exclusion by Search Date % all excluded (title & abstract/full text)		
	Title alone	Abstract / Full Text	Sept 9	Oct 9	Nov 13
Duplicate	9 (0.5%)	1 (0.1%)	0.6%	1.2%	0
Therapy/Testing/Prevention	231 (13.1%)	65 (3.7%)	19.6%	15.9%	14.3%
Healthcare	306 (17.4%)	52 (3.0%)	15.4%	30.4%	17.4%
Unrelated	194 (11.0%)	22 (1.3%)	13.2%	11.3%	12.0%
Limited focus	0	4 (0.2%)	0.6%	0	0
Non-contributory	268 (15.2%)	264 (15.0%)	26.9%	25.2%	38.7%
Non-English	1 (0.1%)	23 (1.3%)	2.3%	0.6%	0.9%
Comment/Response/Erratum	193 (11.0%)	127 (7.2%)	21.5%	15.3%	16.7%
Total excluded/all retrieved (% excluded)	1202/3901 (30.8%)	558/3901 (14.3%)	689/1415 (48.7%)	503/1201 (41.9%)	568/1285 (44.2%)

4.2 Summary of Included Publications for the December 2020 Quarterly Update

Table 2 provides a summary by body system of the articles remaining after screening. These are ordered by Primary Topic as described in Methods.

AESIs already on COVID-19 list: The vast majority of the recently published articles involved AESIs already identified on the COVID-19 list. These are itemized in the 3rd column of Table 2 and the proportions of all new publications were:

- Cardiac: 118 (87.4%) of 135 new publications.
- Neurologic: 216 (63.3%) of 341 new publications.
- Hematologic: 372 (98.9 %) of 376 new publications.
- Dermatologic: 46 (43.0%) of 107 new publications. An additional 41 (29.4%) related to entities that were well described but not considered a priority for the AESI list including urticaria, maculopapular, vesicular and livedoid rashes.
- Gastrointestinal: 7 (26.9%) of 26 new publications
- Liver: 36 (90 %) of 40 new publications
- Kidney: 37 (84.1%) of the 44 new publications addressed acute kidney injury.
- Multisystem inflammatory syndrome: 91 (64.1%) of 142 articles focused on children.

For each of the above, the new publications in the 'General Articles' column focused on the breadth of clinical complications already added to the COVID-19 AESI list. All new publications have been added to the COVID-19 spreadsheet created for the September 2020 literature update (COVID Update Jan_Nov13_2020_Final). The

spreadsheet contains separate tabs for each of the Primary Topics (1 A, B and C identified above). Given smaller numbers a 'Miscellaneous Other' tab combines citation for auto-immune disease, co-infection, enhanced disease and psychiatric illnesses. In addition, the spreadsheet was updated to include all citations that were part of the search done for January 1 through May 16, 2020. The spreadsheet along with this deliverable document is posted on the Brighton Collaboration COVID-19 website page (add link).

TABLE 2. DECEMBER 2020 QUARTERLY UPDATE: QUANTITY AND SCOPE OF ARTICLES RELEVANT TO COVID-19 INFECTION BY BODY SYSTEM AND PRESENCE OR ABSENCE ON CURRENT COVID-19 LIST

BODY SYSTEM	Total Articles	AESI (number articles) already on COVID-19 List	Entities (number articles) Not yet on the AESI list	General Articles
Cardiac (Annex 2)	135	Myocarditis (42), acute cardiac injury (19), STEMI (5), arrhythmia(31), heart failure(3), endothelial dysfunction(1), acute coronary syndrome(1), Takotsubo stress cardiomyopathy(13), MI(3),	cardiac tamponade (3), dilated cardiomyopathy (1), non-bacterial thrombotic endocarditis(1), postural tachycardia syndrome(1), large vessel vasculitis(1)	Meta-analysis (1) Reviews (3) Guideline (1) Pathogenesis (2) Studies (2) Commentary (1)

4.3 Evidence Related to Entities on the May 2020 COVID-19 and Prioritization for a Formal Brighton Case Definition

4.3.1 Cardiovascular injury (Annex 2 and the Cardiac tab in the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final').

Table 3 provides a summary of the total number of publications focused on COVID-19 associated cardiovascular injury that have been screened in as part of the landscape analyses covering January 1st – November 13th, 2020. It also provides a distribution by type of article. Myocarditis has the greatest number of publications, the majority of which are case reports along with 4 reviews and 1 meta-analysis. The next largest number was for cardiac injury which is itself a broad category and could include many of the other cardiac manifestations shown in the table. Most of the articles on cardiac injury focus on pathogenesis (22) and there have been many reviews (10) and meta-analyses (6). Arrhythmias are the next most frequent, most of which are case reports (24) but there also have been 7 reviews and one meta-analysis. Acute coronary syndrome and Takotsubo syndrome (i.e., stress cardiomyopathy) are next in frequency followed by acute heart failure/cardiogenic shock. A total of 46 broad focus articles have been published including 21 reviews and 5 meta-analyses. Full text review of this extensive literature was beyond the scope of this second quarterly update.

TABLE 3. CARDIOVASCULAR INJURY PUBLICATIONS SINCE THE START OF THE COVID-19 PANDEMIC

Publication type Focus / Topic (total)	Review	Meta-analysis	Pathogenesis	Guideline / Registry	Study	Case Report Or Series	Comment
Myocarditis (99)	4	1	2	1	6	77	8
Cardiac Injury (81)	10	6	22	2	18	9	14
Arrhythmias (57)	7	1	5	--	15	24	5
Acute coronary syndromes (49)	--	--	--	2	12	31	4
Takotsubo cardiomyopathy (24)	1	--	--	--	1	22	--
Cardiac failure/shock (19)	1	--	2	1	--	9	6
General / Multiple entities (46)	21	5	8	2	9	--	1
Miscellaneous (8)	--	--	--	--	--	8	--

4.3.2 Haemorrhagic Disorder, including Disseminated Intravascular Coagulation (Annex 4 and the Hematologic tab in the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final').

From January 1 through November 13th, 2020 there have been 696 publications focused on hematologic manifestations of COVID-19. Of these 537 (77.2%) have been focused on thrombosis, thromboembolism, stroke and pulmonary embolus. There have been 99 articles focused on coagulopathy and many of these included thrombosis as well as hemorrhagic manifestations of COVID-19.

4.3.3 Acute Liver Injury (see Annex 7 and the Liver Injury tab in the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final')

Since placing acute liver injury (ALI) on the May COVID-19 AESI list, an additional 12 reviews, 16 meta-analyses and 22 studies have been published summarizing the nature and extent of ALI and examining pathogenesis. Overall abnormal liver function tests are common among hospitalized COVID-19 patients. Any elevation of liver enzymes has been reported in 20-30% of inpatients. Mild abnormalities of liver function tests are usually transient and thought to be a nonspecific reaction to general inflammation. The meta-analysis by Ahmed included articles published to June 18 of 2020 whereas most others did not extend past March or April. Moreover, the Ahmed analysis only included studies with a pre-defined criterion for acute liver injury which was an elevation in transaminases ≥ 3 times the upper limit of normal. A total of 27 studies with 8817 patients were included and the prevalence of liver injury was 15.7% (9.5-23%). One of the articles included in the Ahmed meta-analysis was not recovered as part of the first or second quarterly update (Cai Q, J Hepatology 2020; 73:566-574; <https://doi.org/10.1016/j.jhep.2020.04.006>). A unique aspect of the Cai study is that they defined two patterns of abnormal liver function tests based on whether the picture was primarily hepatocellular (ALT and/or AST > 3 times upper normal limit), cholestatic (ALP or GGT > 2 times upper limit of normal) or mixed with elements of both. They then defined acute liver injury as: ALT and/or AST > 3 times upper limit of normal OR ALP, GGT and/or Total bilirubin > 2 times upper limit of normal. ALI was further classified as hepatocyte (Type 1) if the AST/ALT activity exceeded that of ALP/GGT; and as cholangiotype (Type 2) if AST/ALT activity was less than that of ALP/GGT. Their study included 417 patients with confirmed COVID-19 admitted to a single referral hospital in Shenzhen China. 76.3% had abnormal LFTs and 21.5% met the criterion for ALI during hospitalization. There was a significant link between those with type 1 ALI and severe COVID-19 (Odds Ratio 2.73; 95% Confidence Interval 1.19 - 6.3) especially if it was a mixed pattern (Odds Ratio 4.44; 95% Confidence Interval 1.93-10.23). In contrast Type 2 ALI was not significantly associated with COVID-19 severity. This was also the study that showed that ALI was associated with combination lopinavir/ritonavir therapy. There is no distinct COVID-19 liver pathology based on limited autopsy studies. Several mechanisms have been proposed for COVID-19 associated ALI including drug-toxicity (documented with the combination of Lopinavir-ritonavir), myositis which could also elevate liver enzymes, aggravation of liver injury among those with pre-existing viral hepatitis, viral binding to cholangiocytes leading to liver damage and direct damage to the liver. There is no consensus among the many published reviews and meta-analyses as to cause.

4.3.4 Acute Kidney Injury (see Annex 8 and the Kidney Injury tab of the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final')

Acute kidney injury (AKI) is clearly associated with COVID-19 disease affecting over 20% of hospitalized COVID-19 patients and over 50% of those admitted to ICU (Nadim – multi-country expert consensus report of 25th Acute Disease Quality Initiative Workgroup). A large meta-analysis including 40 studies and 24,527 patients (Shao) showed that development of AKI is clearly associated with mortality: 63% if present versus 13% if not, with Odds Ratio for fatality if AKI present of 14.63 (95% Confidence Interval 9.94-2.51). Overall proteinuria has been documented in 44% of cases, hematuria in 27% and elevated serum creatinine in 14%. In infected individuals with no prior kidney disease, AKI onset is usually 7 to 10 days after admission, whereas it is much earlier, within a few

days of admission, among those with chronic kidney disease prior to infection. Early in the pandemic, evidence suggested that the kidney was a target of SARS-CoV-2 virus based on presence of ACE-2 receptors in the proximal tubules, reports of detection of the virus in urine by PCR and ultrastructure postmortem and biopsy studies claiming to visualize viral particles in the peritubular space and in endothelial cells of glomerular capillary loops. Since May 16 when the SPEAC COVID-19 AESI list, as adopted by the WHO-GACVS, was finalized, a growing body of new evidence, including 10 reviews, 11 meta-analyses and 36 studies, supports pre-renal mechanisms as the cause of AKI. Specifically, the dominant impact is ischemic acute tubular injury due to one or more of: hypoxia, cardiac injury and thrombosis. Four studies claiming to see virus-like particles in the kidney based on autopsy (Su, Farkash, Werion) or biopsy (Kissling) have been disputed by findings in 11 new studies (Diao, Larsen, Peleg, Rossi, Wu, Golmaj, Sharma, Kudose, Roufsse, Santoriello, Akilesh). Two studies demonstrated that SARS-CoV-2 has a tropism for the kidney (Puelles, Braun) but as pointed out by Parmar in an extensive review of the evidence to date, tropism does not equate with pathogenicity. More specifically, while kidney tubular cells have ACE-2 receptors, they lack the transmembrane protease, serine 2 (TMPRSS2), which is needed to facilitate viral entry into the cell.

There have been a few case reports of kidney-specific pathology in COVID-19 including: several reports of collapsing glomerulopathy which is seen in high-risk individuals with a specific variant of the APOL1 gene that is most prevalent in those of African ancestry (Sharma); 2 cases of ANCA-associated vasculitis with glomerulonephritis (Uppal) and 1 case of IgA vasculitis with nephritis – Henoch Schönlein Purpura (Suso).

4.4 Entities Not Yet included on the COVID-19 AESI List

For the September 2020 quarterly update, 4 entities were flagged as possible candidates for addition to the COVID-19 AESI list. Each of these has been updated in this report. Since all citations are in the companion excel spreadsheet, the references are not added as citations for this document. However, they are presented in the appendices as noted below, which identify all relevant citations by review period (16May2020, Q1 review, Q2 review). The full citations can then be found in the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final'.

4.4.1 Autoimmune hemolytic anemia (AIHA) (Hematologic system – see Annex 4 and the Hematologic tab of the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final')

- Prior to Aug 8th: Seven cases of AIHA were reported prior to May 2020 and an additional 5 from May to Aug 8th. Most had underlying conditions that could be associated with the development of AIHA including cancer. One case involved a previously healthy 13-year-old girl (Vega Hernandez P).
- Aug 8 – Nov 13, 2020: There was only a single case report and no other publications related to AIHA.

4.4.2 Rhabdomyolysis Musculoskeletal system – see Annex 10 and the Musculoskeletal tab of the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final')

- Prior to Aug 8th: There were 2 cases reported prior to May 16th and an additional 11 cases from May 16th to Aug 8th. All were male, aged 16-88 years and most had comorbidities (type 2 diabetes, obesity, hypertension). In 10, rhabdomyolysis was the presenting complaint and 3 developed it during the course of hospitalization for COVID-19. Creatinine kinase elevation ranged from mild (1859 U/L) to massive (276,664 U/L). Six had associated acute kidney injury with 4 needing hemodialysis but all recovered.
- Aug 8th – Nov 13, 2020: An additional 19 case reports of rhabdomyolysis were published, bringing the total to 32 since the pandemic started. All together there have been 29 involving males and 3 females. Age has ranged from 15 to 88 years with a median of 48.5 years. Ten had no co-morbidities whereas 22 had one or more pre-existing conditions including: 9 hypertension, 5 obesity, 5 diabetes mellitus and 5 chronic kidney disease. Relative to the COVID-19 illness, 20 had concurrent rhabdomyolysis, 10

developed it after admission for COVID and 2 were admitted for rhabdomyolysis and the COVID-19 diagnosis was made after admission. There was not a clear link between severity of COVID-19 and of rhabdomyolysis. In 10, the rhabdomyolysis led to acute renal failure and dialysis was required. In 16 cases COVID-19 was severe with respiratory failure requiring ventilation. A fatal outcome occurred in 8 cases.

4.4.3 **Thyroiditis** (Endocrine system - see Annex 13 and the Endocrine tab of the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final')

- Prior to August 8th: The first report of thyroiditis was found after May 2020 as part of the 1st quarterly update. There was a total of 5 case reports, 1 from Singapore and 4 from Italy. These were described in the 1st quarterly update. 1 case was Hashimoto's autoimmune thyroiditis involving a previously healthy man with onset 1 week after COVID-19 infection. The other four were all subacute thyroiditis involving women (18-69 years old) with onset 1 to 6 weeks after COVID-19. Muller compared thyroid function in 93 COVID positive patients and 101 pre-pandemic patients admitted to high intensity Italian ICUs in 2020 and 2019, respectively. Evidence of thyrotoxicosis was found in 15% of the COVID patients versus 1% of those admitted in 2019. Eight of the COVID patients were followed for several weeks post discharge and 2 were hypothyroid with features of autoimmune thyroiditis on scan.
- Aug 8 – Nov 13, 2020: Nine more cases of typical subacute thyroiditis were reported (7F/2M; age range 28-46 years). Most had mild COVID-19 illness managed at home; no severe cases but 1 admitted to hospital. Onset ranged from 9 days to 5 weeks after COVID-19 resolved. All responded quickly to oral prednisone or ibuprofen therapy; most were euthyroid within 6-10 weeks. Also, there was a single case of postpartum thyroiditis (Mizuno-Japan) 4.5 months following delivery and 9 days after discharge from hospital where she had spent 4 weeks for moderately severe COVID-19.

4.4.3 **Acute pancreatitis** (previously Gastrointestinal system; now under Endocrine system - see Annex 13 and the Endocrine tab of the excel spreadsheet 'COVID Update Jan_Nov13_2020_Final')

- Prior to August 8th: An early report from China (Wang F) noted that 17% of 52 COVID-19 patients had evidence of pancreatic injury, defined as any abnormality in amylase or lipase but did not comment on symptoms. In the 1st Quarter update, there were 14 case reports of acute pancreatitis, which was the presenting complaint for 5, concurrent with COVID19 infection in 2, onset after COVID-19 admission for 6 and couldn't be determined for 1. Known etiologic causes of pancreatitis (alcohol, gallstones, trauma, recent invasive procedures) were ruled out in most and all recovered. There was also a US study of 339 admissions for acute pancreatitis among whom 75 were tested for COVID (Dirweesh A). No other cause for pancreatitis was found among 57% of the 14 COVID confirmed cases versus only 2% of 61 COVID negative cases. Mortality was 21% and 2% respectively.
- Aug 8 – Nov 13, 2020: Two additional studies (Imandar, Akarsu) had similar findings to Dirweesh. Both compared acute pancreatitis among concurrently hospitalized COVID positive and negative cases during the pandemic. Imandar found that after ruling out known causes of pancreatitis, idiopathic cases were more frequent in COVID-19 positive (69%) than COVID-19 negative (21%) cases. In the Akarsu series, acute pancreatitis was found in 0 of 50 mild COVID-19 cases, 7.9% of 189 severe COVID-19 cases and 32.5% of 77 critical COVID-19 cases. Mortality was 32% of COVID-19 positive acute pancreatitis cases versus 8% of COVID-19 negative pancreatitis cases. There were an additional 22 new published case reports of pancreatitis associated with COVID-19.
- In total during the COVID-19 pandemic to November 13, there have been 36 case reports, 16 females and 20 males. Ages ranged from 7 to 76 years with a median of 38 years. In 14 cases there were no co-morbidities whereas 11 were obese, 8 had hypertension and 2 had diabetes mellitus. Several had more than one co-morbidity. Relative to the onset of COVID-19, 5 preceded it, 13

presented concurrently, 17 followed the COVID-19 presentation and 1 presented as pancreatitis and never developed typical COVID-19 symptoms but had a confirmed SARS-CoV-2 positive PCR. Two cases had a fatal outcome.

4.4.4 **Pregnancy Outcomes:** Maternal, Fetal, Neonatal (see the Mixed clinical tab and the Pregnancy tab of the companion excel COVID Update Jan_Nov13_2020)

As per Table 2 there have been 152 new publications focused on various aspects of pregnancy outcomes from Aug 8 through Nov 13, 2020. As was the case in the September 2020 Quarterly update, the sheer volume of publications did not allow thorough review.

4.4.5 **Chronic complications of COVID-19** (see Annex 14)

There is a growing understanding that COVID-19 complications extend beyond the acute illness. As shown in Table 2 there were 19 articles focusing on long term-complications published from August 8 to Nov 13, 2020. Long term pulmonary fibrosis has been the topic of some, but most are theoretical in nature focused on the potential for long-term neurologic complications such as parkinsonism. A single Egyptian study (Tolba) noted persisting symptoms for several months after recovering from COVID-19, with fatigue the most prominent. In their discussion they noted that similar findings occurred following SARS-CoV-1 outbreak. The term “Long-Haul syndrome” has been used to describe such cases where the predominant feature is clearly fatigue accompanied by a number of other general symptoms including depression, myalgia/arthritis, disordered sleep and so on. The current search strategy only identified the single Egyptian study and will need to be amended to focus on this entity.

4.4 Quarterly Review Workload

Completion of the December 2020 quarterly update required 10 hours for screening, 85.25 hours to read and summarize new citations and 27.75 hours to prepare and revise the deliverable.

5. Recommendations & discussion

The results of the second quarterly update for the COVID-19 AESI priority list have been presented above along with: a cumulative summary of publications since January focused on cardiovascular injury and coagulation disorders; as well as an overview of what has been seen since the start of the COVID-19 pandemic for acute liver injury, acute kidney injury, autoimmune hemolytic anemia, rhabdomyolysis, acute pancreatitis and subacute thyroiditis. Based on these results SPEAC has the following recommendations:

5.1 Regarding new AESI for the COVID-19 list

5.1.1 Add the following entities to the AESI list: subacute thyroiditis, pancreatitis and rhabdomyolysis:

Subacute thyroiditis occurs predominantly as a post-infectious illness with onset several weeks after the acute COVID-19. In contrast pancreatitis and rhabdomyolysis are clearly part of acute COVID-19 illness, similar to acute cardiovascular, kidney and liver injuries. The mechanisms are unclear and while they could be considered part of the multi-organ dysfunction that is seen in COVID-19 it is also clearly the case that COVID-19 may present with features of either and in some cases not manifest the usual respiratory features of illness. Prior to prioritizing any of these to the list for new Brighton case definitions, a search for international standards will be made and adopted

if there are widely accepted case definitions. With the entities added to the AESI list, SPEAC will develop resources and tools related to each including background rates and risk factors, ICD-9 /10-CM and MedDRA codes.

5.1.2 There is insufficient evidence to support the addition of acute hemolytic anemia to the AESI list.

5.2 AESI for COVID-19 and development of new Brighton case definitions

5.2.1 Defer a decision related to acute cardiovascular injuries other than myocarditis/pericarditis until the case definition currently being developed is completed (expected by January 2021) in conjunction with further review of existing literature on the other entities.

5.2.2 Proceed with development of a Brighton case definition for coagulation disorder involving bleeding and disseminated intravascular coagulation but align the prioritization with other CEPI target diseases for which this is an AESI (Lassa Fever, MERS, Rift Valley Fever).

5.2.3 Acute Liver Injury (ALI): International consensus guidelines could not be found for acute liver injury. There are definitions for acute liver failure but that is rare in COVID-19. The meta-analysis by Ahmed and study of liver function tests in COVID-19 by Cai were presented in some detail in the results section above because they provide a basis for defining ALI used by many other authors publishing on ALI in COVID-19. Thus, it is proposed that the following definition of ALI be used:

- > 3-fold elevation above the upper normal limit for ALT or AST OR
- > 2-fold elevation above the upper normal limit for total serum bilirubin or GGT or ALP
- As done by Cai, measuring all 4 liver enzymes (ALT, AST, GGT, ALP) and total bilirubin will enable defining the pattern of injury as hepatocytic, cholangiocytic or mixed and further whether it is a type 1 ALI (ALT/AST > GGT/ALP) or Type 2 ALI (ALT/AST < GGT/ALP).

5.2.4 Acute kidney injury (AKI): Several international guidelines exist and have been reviewed (Thomas ME, Blaine C, Dawnay A et al. The definition of acute kidney injury and its use in practice. *Kidney International* 2015; 87:62-73. Doi:10.1038/ki.2014.328). The Risk, Injury, Failure, Loss and End-stage renal disease (RIFLE) classification was developed in 2004 by the Acute Dialysis Quality Initiative Group. A modification was made by the Acute Kidney Injury Network (AKIN) in 2007 and then the two were merged in 2012 by the Kidney Disease Improving Global Outcomes (KDIGO) expert consensus group (see www.kdigo.org). In the absence of a Brighton Case Definition, it is recommended to use the criteria for detecting AKI, as defined by KDIGO below:

- Increase in serum creatinine by ≥ 0.3 mg/dl (≥ 26.5 μ mol/l) within 48 hours; OR
- Increase in serum creatinine to ≥ 1.5 times baseline, which is known or presumed to have occurred within the prior 7 days OR
- Urine volume ≤ 0.5 ml/ kg/ hour for 6 hours

The Thomas review article also presents the modified pRIFLE criteria for defining AKI in children >1 month old. The article also discusses the relative merits and limitations of the KDIGO and other criteria.

5.3 Regarding a consolidation of the literature reviewed as part of the COVID-19 landscape analyses from January 1 through November 13, 2020

The appendices 2 through 14 provide a summary of the quantity, focus and publication type for all included citations. The full citations have been captured in the excel spreadsheet "COVID Update for Jan_Nov13_2020_Final" which is a companion to this deliverable.

5.4 Regarding the process to be followed for the next quarterly update of COVID-19

Reviewing of the literature is a time-consuming task. We recommend to:

- 5.4.1 Narrow the focus of the literature review to entities that need time to emerge specifically, pregnancy outcomes, manifestations of COVID-19 in children and the 'long haul COVID' and other chronic complications.
- 5.4.2 Conduct full text review of systematic reviews and meta-analyses already identified that focus on the diverse types of cardiovascular injury other than myocarditis and pericarditis in order to determine whether or not Brighton case definitions should be developed for one or more.

ANNEXES

Annex I

Search Strategy for literature relevant to updates to the potential AESI list for covid-19 (used to retrieve articles from Aug 7 to Nov 13, 2020)

The only difference between this and the search strategy used for Quarter 1 updates since July 2020 was to exclude PMIDs from all previous searches, as a strategy to reduce the number of duplicates.
